Dt Sep18th, 2026

- Worked on creating and configuring an Azure DevOps YAML pipeline for an ASP.NET/.NET application.

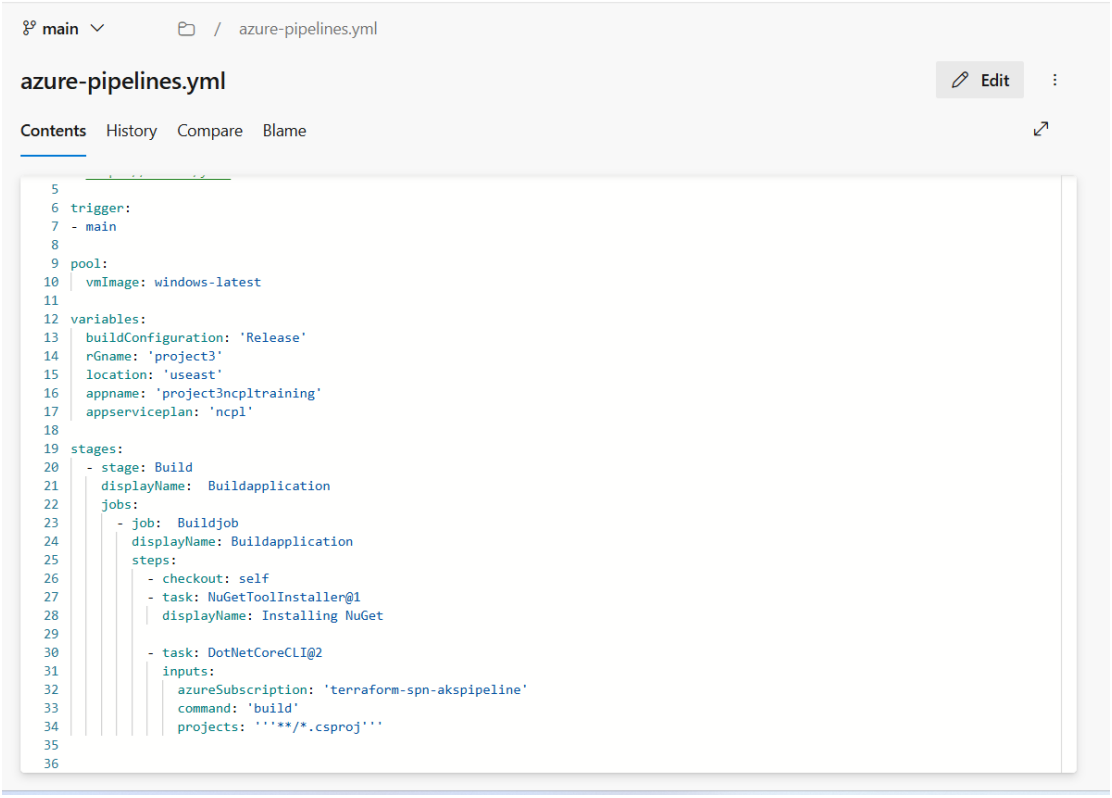

- Created the ASP.NET project in Azure DevOps.

- Imported the application code into the Azure DevOps repository.

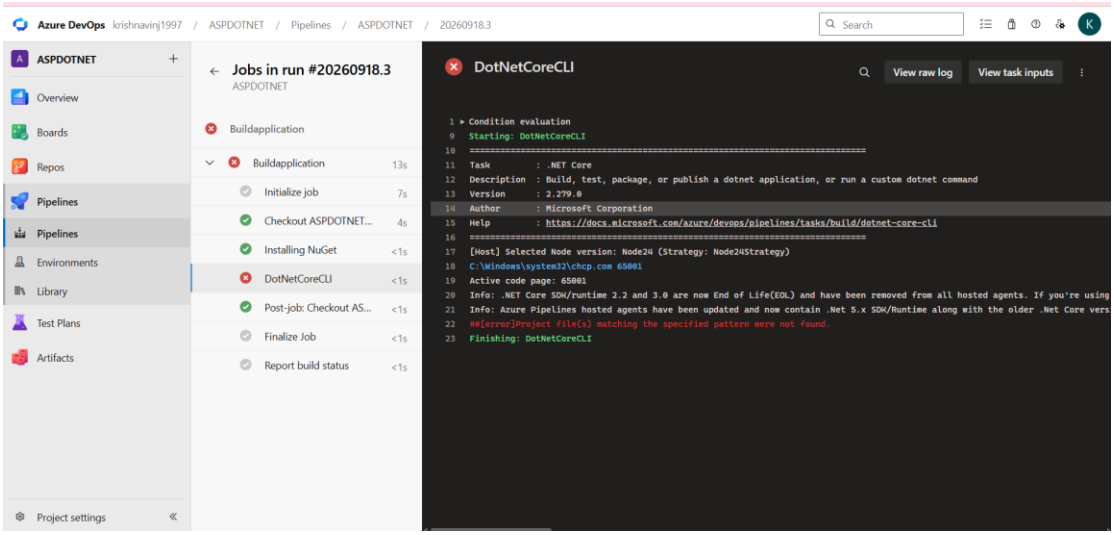

YAML Pipeline Configuration

- Deleted the existing Azure Pipelines YAML file as instructed by the trainer.
- Started creating a new custom YAML pipeline.
- Configured the pipeline with a Windows latest VM image.
- Added pipeline variables such as:
    - Build configuration
    - Resource group name
    - Azure location
    - Application name
    - App Service Plan name

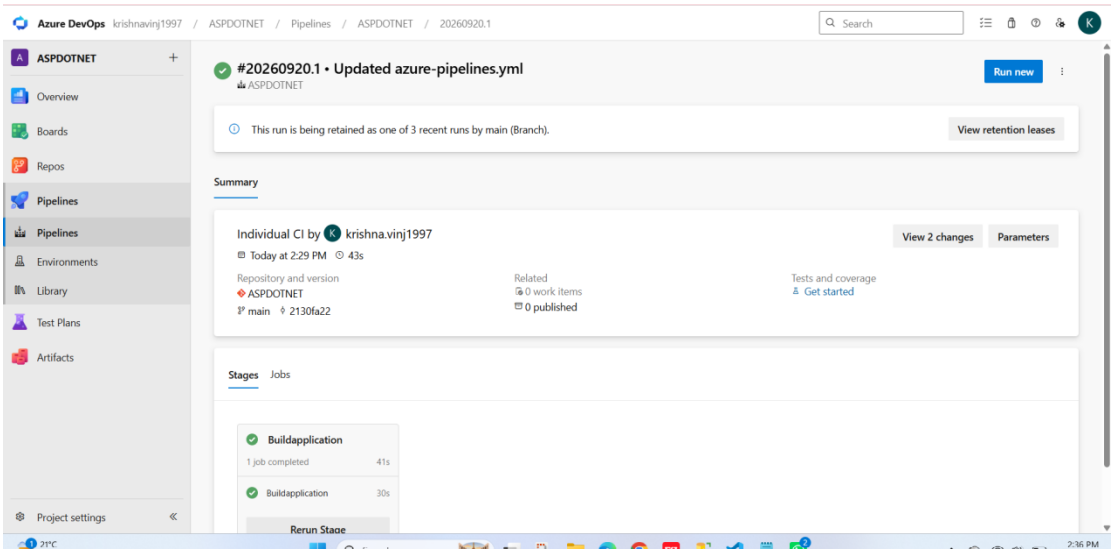

- The projects: line in my azure-pipelines.yml had extra/wrong quotes around the file pattern, so it didn't match my .csproj file."

- Line 34 in azure-pipelines.yml: projects: '"**/*.csproj""'

- Changed it to projects: '**/*.csproj'

- Fixed the build failure by correcting the project file path in azure-pipelines.yml. Pipeline run #20260920.1 completed successfully in 43 seconds, confirming the issue is resolved.

Dt Sep 21st, 2026

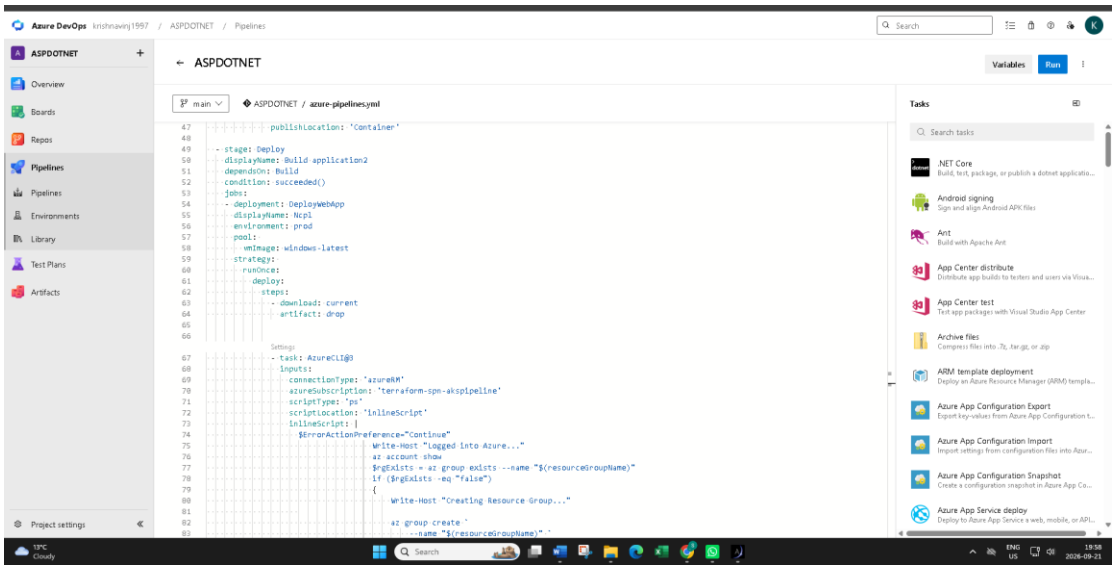

Updated the Azure DevOps YAML pipeline

- I edited the existing YAML pipeline.
- I added the **.NET Core publish task**.

```yaml
Settings
- task: DotNetCoreCLI@2
  inputs:
    azureSubscription: 'terraform-spn-akspipeline'
    command: 'publish'
    publishWebProjects: true
    arguments: '--configuration $(buildConfiguration) --output $(Build.ArtifactStagingDirectory)'
    modifyOutputPath: false
Settings
- task: PublishBuildArtifacts@1
  inputs:
    PathtoPublish: '$(Build.ArtifactStagingDirectory)'
    ArtifactName: 'drop'
    publishLocation: 'Container'
```

- Published the build artifact.

- Created the Deploy stage.

- Configured Azure App Service deployment.

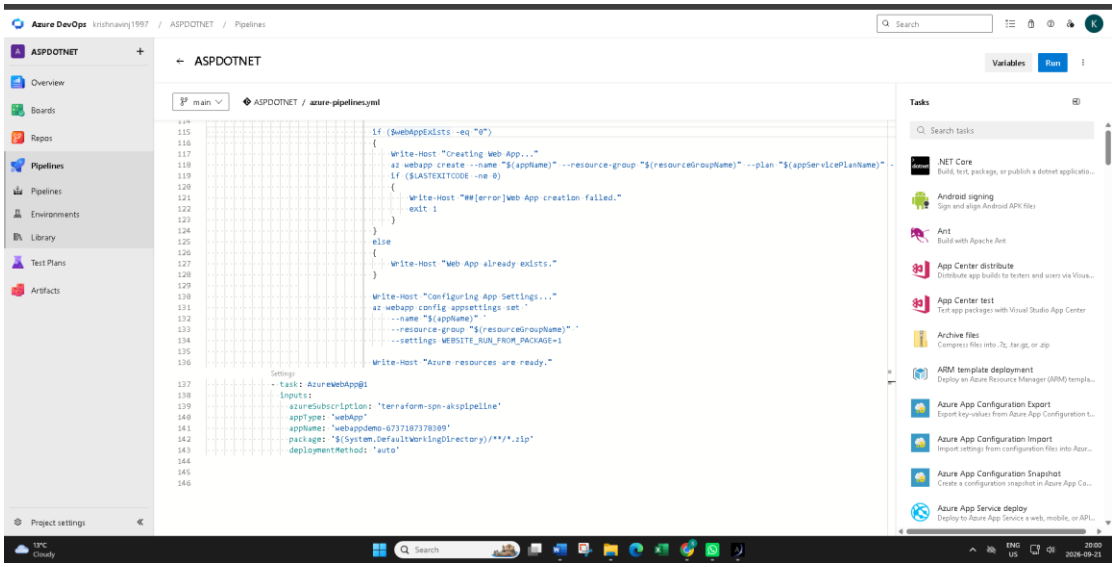

- Configured runOnce deployment.

- Troubleshot pipeline errors.

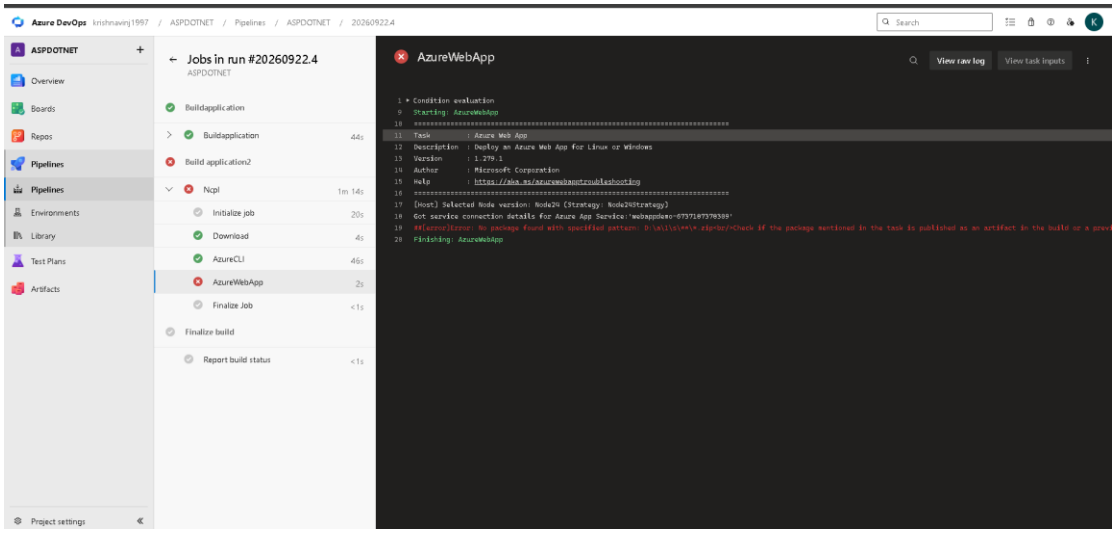

- Corrected Azure region

Changed the location from US East to East US as instructed.

- Corrected Azure Web App configuration

- Azure Web App failed.

- Issue: Azure DevOps pipeline failed during the Deploy stage while trying to publish the Web App.

Error 1: No package found with specified pattern: D:\a\1\s***.zip
Simple explanation: The pipeline was looking for the zip file in the wrong folder (the source code folder) instead of the folder where the build artifact was downloaded.

Fix 1: Changed the package path in the AzureWebApp@1 task from $(System.DefaultWorkingDirectory)/**/*.zip to $(Pipeline.Workspace)/drop/*.zip, so it looks in the correct downloaded artifact folder.

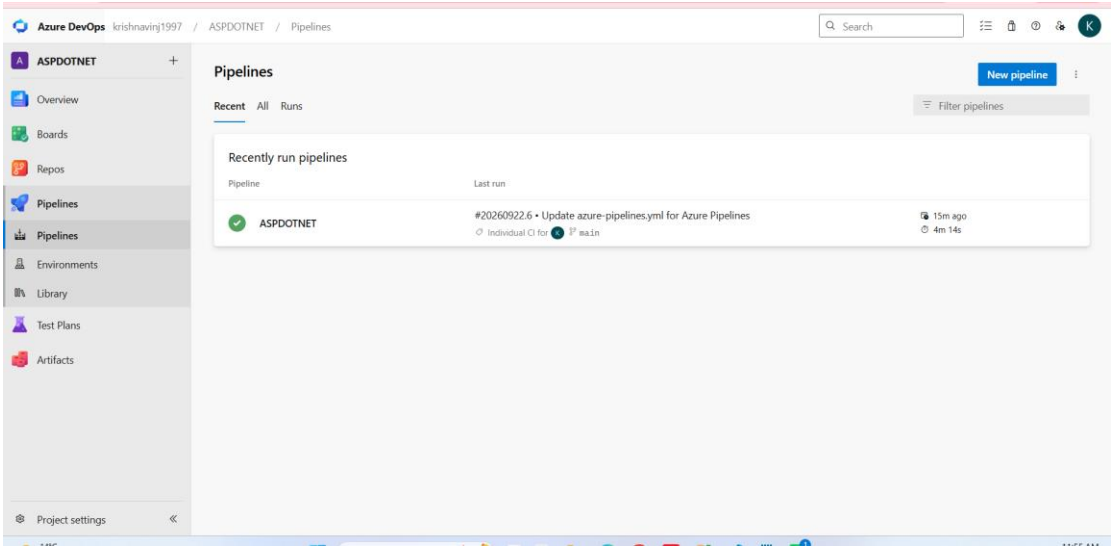

Error 2: More than one package matched with specified pattern: D:\a\1\drop*.zip
Simple explanation: The wildcard *.zip matched more than one zip file inside the drop folder, so Azure didn't know which one to deploy.

Fix 2: Changed the package path to point to the exact file name instead of a wildcard: $(Pipeline.Workspace)/drop/drop.zip.

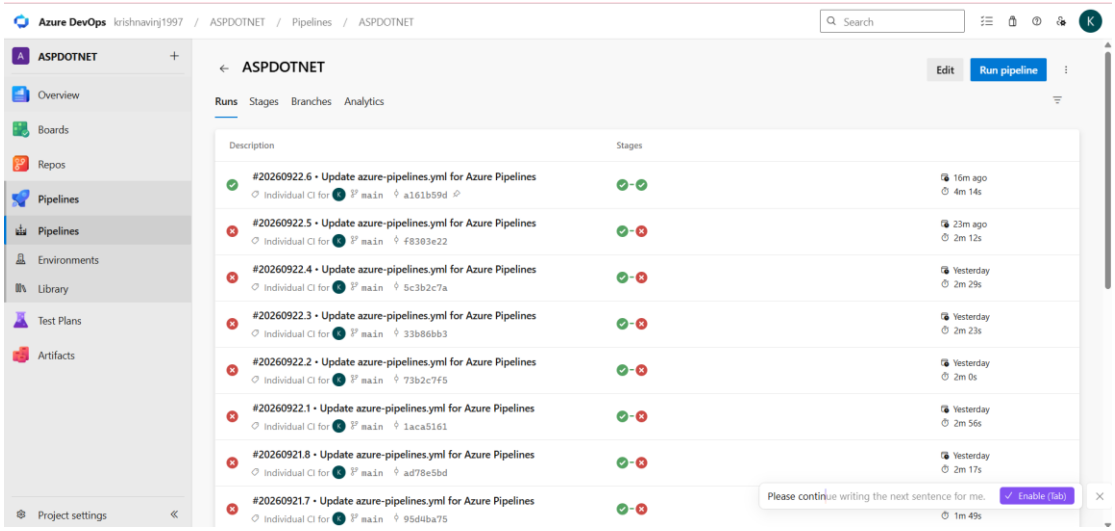

Result: Pipeline deployed successfully after this change.

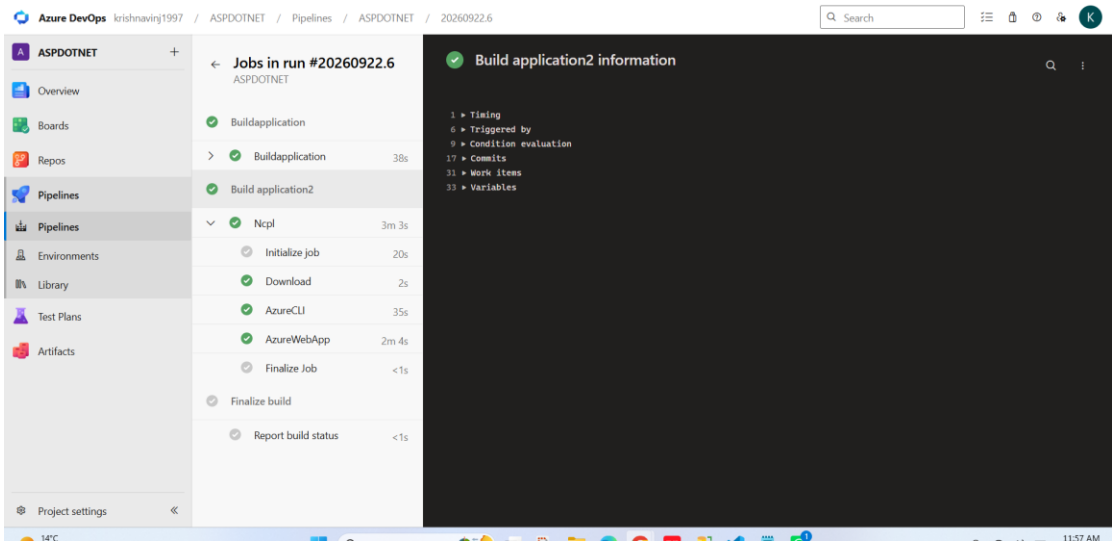

- Pipeline Successful.

- Earlier failed multiple times later succeeded.
